

# IS31FL3235A

## 28 CHANNELS LED DRIVER

February 2017

### GENERAL DESCRIPTION

IS31FL3235A is comprised of 28 constant current channels each with independent PWM control, designed for driving LEDs, PWM frequency can be 3kHz or 22kHz. The output current of each channel can be set at up to 38mA (Max.) by an external resistor and independently scaled by a factor of 1, 1/2, 1/3 and 1/4. The average LED current of each channel can be changed in 256 steps by changing the PWM duty cycle through an I2C interface.

The chip can be turned off by pulling the SDB pin low or by using the software shutdown feature to reduce power consumption.

IS31FL3235A is available in QFN-36 (4mm × 4mm) package. It operates from 2.7V to 5.5V over the temperature range of -40°C to +85°C.

### FEATURES

- 2.7V to 5.5V supply
- I2C interface, automatic address increment function
- Internal reset register
- Modulate LED brightness with 256 steps PWM
- Each channel can be controlled independently
- Each channel can be scaled independently by 1, 1/2, 1/3 and 1/4
- PWM frequency selectable
  - 3kHz (default)
  - 22kHz
- -40°C to +85°C temperature range
- ESD HBM 8kV
- QFN-36 (4mm × 4mm) package

### APPLICATIONS

- Mobile phones and other hand-held devices for LED display
- LED in home appliances

### TYPICAL APPLICATION CIRCUIT

Figure 1 Typical Application Circuit

**Note 1:** The maximum global output current is set up to 23mA when  $R_{EXT} = 3.3k\Omega$ . The maximum global output current can be set by external resistor,  $R_{EXT}$ . Please refer to the detail information in Page 10.

**Note 2:** The IC should be placed far away from the mobile antenna in order to prevent the EMI.

## PIN CONFIGURATION

| Package | Pin Configuration (Top View)   |
|---------|--|
| QFN-36  |  <p>Diagram showing the pin configuration for the QFN-36 package. The chip is square with pins numbered 1 to 36. Pin 1 is at the top-left corner. Pins 2-14 are along the left edge, pins 15-28 along the right edge, pins 29-32 along the bottom edge, and pins 33-36 along the top edge. A thermal pad is located at the top-left corner, between pins 1 and 36.</p> |

## PIN DESCRIPTION

| No.     | Pin           | Description  |
|---------|---------------|--|
| 1 ~ 13  | OUT2 ~ OUT14  | Output channel 2~14 for LEDs.  |
| 14, 32  | GND           | Ground.  |
| 15 ~ 28 | OUT15 ~ OUT28 | Output channel 15~28 for LEDs.   |
| 29      | SDB           | Shutdown the chip when pulled low.   |
| 30      | AD            | I2C address setting.   |
| 31      | VCC           | Power supply.  |
| 33      | R_EXT         | Input terminal used to connect an external resistor. This regulates the global output current. |
| 34      | SDA           | I2C serial data.   |
| 35      | SCL           | I2C serial clock.  |
| 36      | OUT1          | Output channel 1 for LEDs.   |
|         | Thermal Pad   | Connect to GND.  |

## ABSOLUTE MAXIMUM RATINGS

|  |                       |
|--|-----------------------|
| Supply voltage, $V_{CC}$   | -0.3V ~ +6.0V         |
| Voltage at SCL, SDA, SDB, OUT1 to OUT28  | -0.3V ~ $V_{CC}+0.3V$ |
| Maximum junction temperature, $T_{JMAX}$   | 150°C                 |
| Storage temperature range, $T_{STG}$   | -65°C ~ +150°C        |
| Operating temperature range, $T_A$   | -40°C ~ +85°C         |
| Package thermal resistance (Mounted on JEDEC standard 4 layer(2s2p) PCB test board), $\theta_{JA}$ | 32.9°C/W              |
| ESD (HBM)  | ±8kV                  |
| ESD (CDM)  | ±1kV                  |

### Note:

Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

Typical values are  $T_A = 25^\circ\text{C}$ ,  $V_{CC} = 3.6V$ .

| Symbol        | Parameter                      | Condition   | Min. | Typ.            | Max. | Unit             |
|---------------|--------------------------------|---|------|-----------------|------|------------------|

## DIGITAL INPUT SWITCHING CHARACTERISTICS (Note 2)

| Symbol        | Parameter  | Condition | Min. | Typ.        | Max. | Unit    |
|---------------|--|-----------|------|-------------|------|---------|
| $f_{SCL}$     | Serial-Clock frequency                             |           |      |             | 400  | kHz     |
| $t_{BUF}$     | Bus free time between a STOP and a START condition |           | 1.3  |             |      | $\mu$ s |
| $t_{HD, STA}$ | Hold time (repeated) START condition               |           | 0.6  |             |      | $\mu$ s |
| $t_{SU, STA}$ | Repeated START condition setup time                |           | 0.6  |             |      | $\mu$ s |
| $t_{SU, STO}$ | STOP condition setup time                          |           | 0.6  |             |      | $\mu$ s |
| $t_{HD, DAT}$ | Data hold time                                     |           |      |             | 0.9  | $\mu$ s |
| $t_{SU, DAT}$ | Data setup time                                    |           | 100  |             |      | ns      |
| $t_{LOW}$     | SCL clock low period                               |           | 1.3  |             |      | $\mu$ s |
| $t_{HIGH}$    | SCL clock high period                              |           | 0.7  |             |      | $\mu$ s |
| $t_R$         | Rise time of both SDA and SCL signals, receiving   | (Note 3)  |      | $20+0.1C_b$ | 300  | ns      |
| $t_F$         | Fall time of both SDA and SCL signals, receiving   | (Note 3)  |      | $20+0.1C_b$ | 300  | ns      |

**Note 1:** The recommended minimum value of  $R_{EXT}$  is 2k $\Omega$ , or it may cause a large current.

**Note 2:** Guaranteed by design.

**Note 3:**  $C_b$  = total capacitance of one bus line in pF.  $I_{SINK} \leq 6mA$ .  $t_R$  and  $t_F$  measured between  $0.3 \times V_{CC}$  and  $0.7 \times V_{CC}$ .

# IS31FL3235A

## DETAILED DESCRIPTION

### I2C INTERFACE

The IS31FL3235A uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS31FL3235A has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Since IS31FL3235A only supports write operations, A0 must always be "0". The value of bits A1 and A2 are decided by the connection of the AD pin.

The complete slave address is:

**Table 1 Slave Address (Write only):**

| Bit   | A7:A3 | A2:A1 | A0 |
|-------|-------|-------|----|
| Value | 01111 | AD    | 0  |

AD connected to GND, AD = 00;  
 AD connected to VCC, AD = 11;  
 AD connected to SCL, AD = 01;  
 AD connected to SDA, AD = 10;

The SCL line is uni-directional. The SDA line is bi-directional (open-collector) with a pull-up resistor (typically 4.7kΩ). The maximum clock frequency specified by the I2C standard is 400kHz. In this discussion, the master is the microcontroller and the slave is the IS31FL3235A.

The timing diagram for the I2C is shown in Figure 2. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS31FL3235A's acknowledge. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If the IS31FL3235A has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS31FL3235A, the register address byte is sent, most significant bit first. IS31FL3235A must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS31FL3235A must generate another acknowledge to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

### ADDRESS AUTO INCREMENT

To write multiple bytes of data into IS31FL3235A, load the address of the data register that the first data byte is intended for. During the IS31FL3235A acknowledge of receiving the data byte, the internal address pointer will increment by one. The next data byte sent to IS31FL3235A will be placed in the new address, and so on. The auto increment of the address will continue as long as data continues to be written to IS31FL3235A (Figure 5).

## REGISTERS DEFINITIONS

Table 2 Register Function

| Address | Name                              | Function  | Table | Default   |
|---------|-----------------------------------|---|-------|-----------|
| 00h     | Shutdown Register                 | Set software shutdown mode                        | 3     | 0000 0000 |
| 05h~20h | PWM Register                      | 28 channels PWM duty cycle data register          | 4     |           |
| 25h     | Update Register                   | Load PWM Register and LED Control Register's data | -     | xxxx xxxx |
| 2Ah~45h | LED Control Register              | Channel 1 to 28 enable bit and current setting    | 5     | 0000 0000 |
| 4Ah     | Global Control Register           | Set all channels enable                           | 6     |           |
| 4Bh     | Output frequency setting register | Set all channels operating frequency              | 7     | 0000 0000 |
| 4Fh     | Reset Register                    | Reset all registers into default value            | -     | xxxx xxxx |

Table 3 00h Shutdown Register

| Bit     | D7:D1   | D0  |
|---------|---------|-----|
| Name    | -       | SSD |
| Default | 0000000 | 0   |

The Shutdown Register sets software shutdown mode of IS31FL3235A.

|            |                          |
|------------|--------------------------|
| <b>SSD</b> | Software Shutdown Enable |
| 0          | Software shutdown mode   |
| 1          | Normal operation         |

Table 4 05h~20h PWM Register(OUT1~OUT28)

| Bit     | D7:D0     |
|---------|-----------|
| Name    | PWM       |
| Default | 0000 0000 |

The PWM Registers adjusts LED luminous intensity in 256 steps.

The value of a channel's PWM Register decides the average output current for each output, OUT1~OUT28. The average output current may be computed using the Formula (1):

$$I_{\text{PWM}} = \frac{I_{\text{OUT}}}{256} \cdot \sum_{n=0}^7 D[n] \cdot 2^n \quad (1)$$

Where "n" indicates the bit location in the respective PWM register.

# IS31FL3235A

For example: D7:D0 = 10110101,

$$I_{OUT} = I_{MAX} (2^0 + 2^2 + 2^4 + 2^5 + 2^7) / 256$$

The  $I_{OUT}$  of each channel is setting by the SL bit of LED Control Register (2Ah~45h). Please refer to the detail information in Page 10.

## 25h PWM Update Register

The data sent to the PWM Registers and the LED Control Registers will be stored in temporary registers. A write operation of "0000 0000" value to the Update Register is required to update the registers (05h~20h, 2Ah~45h).

**Table 5 2Ah~45h LED Control Register (OUT1~OUT28)**

| Bit     | D7:D3 | D2:D1 | D0  |
|---------|-------|-------|-----|
| Name    | -     | SL    | OUT |
| Default | 00000 | 00    | 0   |

The LED Control Registers store the on or off state of each LED and set the output current.

**SL** Output Current Setting ( $I_{OUT}$ )

|    |             |
|----|-------------|
| 00 | $I_{MAX}$   |
| 01 | $I_{MAX}/2$ |
| 10 | $I_{MAX}/3$ |
| 11 | $I_{MAX}/4$ |

**OUT** LED State

|   |         |
|---|---------|
| 0 | LED off |
| 1 | LED on  |

**Table 6 4Ah Global Control Register**

| Bit     | D7:D1   | D0   |
|---------|---------|------|
| Name    | -       | G_EN |
| Default | 0000000 | 0    |

The Global Control Register set all channels enable.

**G\_EN** Global LED Enable

|   |                   |
|---|-------------------|
| 0 | Normal operation  |
| 1 | Shutdown all LEDs |

**Table 7 4Bh Output Frequency Setting Register**

| Bit     | D7:D1   | D0  |
|---------|---------|-----|
| Name    | -       | OFS |
| Default | 0000000 | 0   |

The Output Frequency Setting Register selects a fixed PWM operating frequency for all output channels.

**OFS** Output Frequency Setting

|   |       |
|---|-------|
| 0 | 3kHz  |
| 1 | 22kHz |

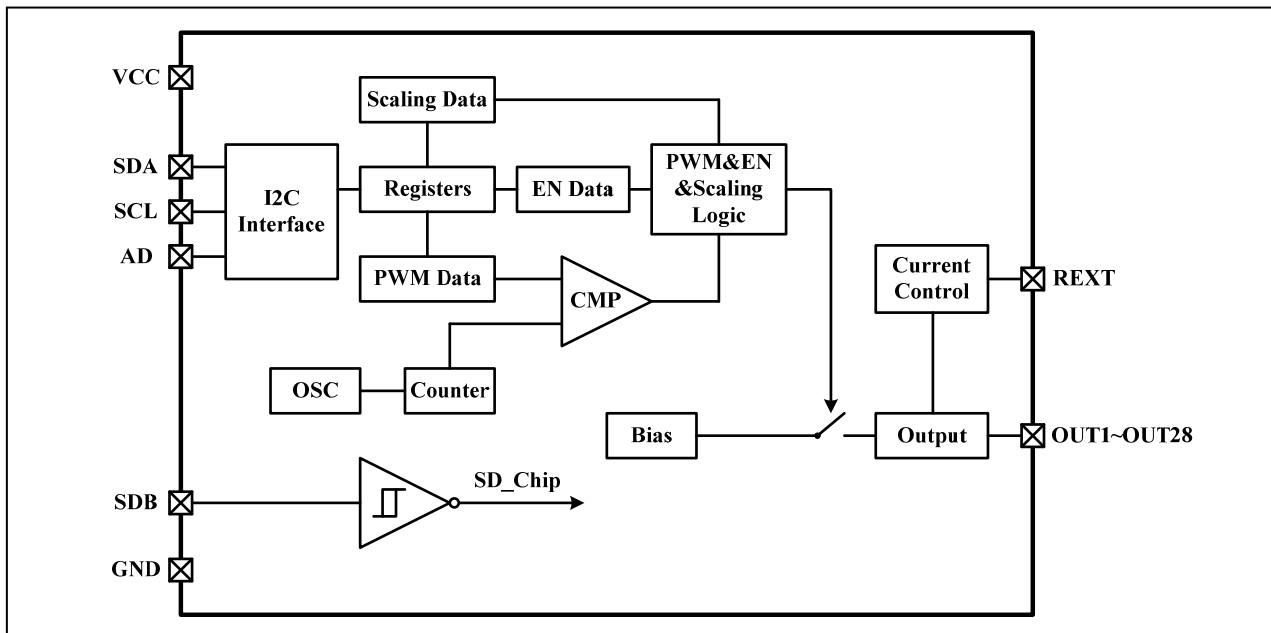

## 4Fh Reset Register

Once user writes "0000 0000" data to the Reset Register, IS31FL3235A will reset all registers to default value. On initial power-up, the IS31FL3235A registers are reset to their default values for a blank display.

# IS31FL3235A

## FUNCTIONAL BLOCK DIAGRAM

# IS31FL3235A

## TYPICAL APPLICATION

### PWM CONTROL

The PWM Registers (05h~2Ah) can modulate LED brightness of 28 channels with 256 steps. For example, if the data in PWM Register is “0000 0100”, then the PWM is the fourth step.

Writing new data continuously to the registers can modulate the brightness of the LEDs to achieve a breathing effect.

#### R<sub>EXT</sub>

The maximum output current of OUT1~OUT28 can be adjusted by the external resistor, R<sub>EXT</sub>, as described in Formula (2).

$$I_{MAX} = x \cdot \frac{V_{EXT}}{R_{EXT}} \quad (2)$$

x = 58.5, V<sub>OUT</sub> = 0.8V, V<sub>EXT</sub> = 1.3V.

The recommended minimum value of R<sub>EXT</sub> is 2kΩ.

### CURRENT SETTING

The current of each LED can be set independently by the SL bit of LED Control Register (2Ah~45h). The maximum global current is set by the external register R<sub>EXT</sub>.

When channels drive different quantity of LEDs, adjust maximum output current according to quantity of LEDs to ensure average current of each LED is the same.

For example, set R<sub>EXT</sub> = 3.3kΩ then I<sub>MAX</sub> = 23mA. If OUT1 drives two LEDs and OUT2 drives four LEDs, set the SL bit of LED Control Register (2Ah) to “01” and SL bit of LED Control Register (2Bh) to “00”. So the current of OUT1 is I<sub>OUT1</sub> = I<sub>MAX</sub>/2 = 11.5mA and the current of OUT2 is I<sub>OUT2</sub> = I<sub>MAX</sub> = 23mA. The average current of each LED is the same.

### GAMMA CORRECTION

In order to perform a better visual LED breathing effect we recommend using a gamma corrected PWM value to set the LED intensity. This results in a reduced number of steps for the LED intensity setting, but causes the change in intensity to appear more linear to the human eye.

Gamma correction, also known as gamma compression or encoding, is used to encode linear luminance to match the non-linear characteristics of display. Since the IS31FL3235A can modulate the brightness of the LEDs with 256 steps, a gamma correction function can be applied when computing each subsequent LED intensity setting such that the changes in brightness matches the human eye's brightness curve.

**Table 8 32 gamma steps with 256 PWM steps**

|       |       |       |       |       |       |       |       |

**Figure 6** Gamma Correction (32 Steps)

Choosing more gamma steps provides for a more continuous looking breathing effect. This is useful for very long breathing cycles. The recommended configuration is defined by the breath cycle T. When T=1s, choose 32 gamma steps, when T=2s, choose 64 gamma steps. The user must decide the final number of gamma steps not only by the LED itself, but also based on the visual performance of the finished product.

**Table 9 64 gamma steps with 256 PWM steps**

|       |       |       |       |       |       |       |       |

**Figure 7** Gamma Correction (64 Steps)

Note, the data of 32 gamma steps is the standard value and the data of 64 gamma steps is the recommended value.

## SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

## SOFTWARE SHUTDOWN

By setting SSD bit of the Shutdown Register (00h) to "0", the IS31FL3235A will operate in software shutdown mode. When the IS31FL3235A is in software shutdown mode, all current sources are switched off.

## HARDWARE SHUTDOWN

The chip enters hardware shutdown mode when the SDB pin is pulled low.

## PWM FREQUENCY SELECT

The IS31FL3235A output channels operate with a default PWM frequency of 3kHz. Because all the OUTx channels are synchronized, the DC supply will experience large instantaneous current surges when the OUTx channels turn ON. These current surges will

generate an AC ripple on the power supply which cause stress to the decoupling capacitors.

When the AC ripple is applied to a monolithic ceramic capacitor chip (MLCC) it will expand and contract causing the PCB to flex and generate audible hum in the range of between 20Hz to 20kHz, To avoid this hum, there are many countermeasures, such as selecting the capacitor type and value which will not cause the PCB to flex and contract.

An additional option for avoiding audible hum is to set the IS31FL3235A's output PWM frequency above the audible range. The Output Frequency Setting Register 4Bh bit D0 can be used to set the switching frequency to 22kHz, which is beyond the audible range. Figure 8 below shows the variation of output PWM frequency across supply voltage and temperature.

**Figure 8** VCC vs. OUTPUT PWM Frequency

## CLASSIFICATION REFLOW PROFILES

| Profile Feature   | Pb-Free Assembly |
|---|------------------|
| <b>Preheat &amp; Soak</b>   |                  |
| Temperature min (T <sub>smin</sub> )  | 150°C            |
| Temperature max (T <sub>smax</sub> )  | 200°C            |
| Time (T <sub>smin</sub> to T <sub>smax</sub> ) (t <sub>s</sub> )                                  | 60-120 seconds   |
| Average ramp-up rate (T <sub>smax</sub> to T <sub>p</sub> )                                       | 3°C/second max.  |
| Liquidous temperature (T <sub>L</sub> )   | 217°C            |
| Time at liquidous (t <sub>L</sub> )   | 60-150 seconds   |
| Peak package body temperature (T <sub>p</sub> )*  | Max 260°C        |
| Time (t <sub>p</sub> )** within 5°C of the specified classification temperature (T <sub>c</sub> ) | Max 30 seconds   |
| Average ramp-down rate (T <sub>p</sub> to T <sub>smax</sub> )                                     | 6°C/second max.  |
| Time 25°C to peak temperature   | 8 minutes max.   |

## PACKAGE INFORMATION

QFN-36

# IS31FL3235A

## RECOMMENDED LAND PATTERN

### QFN-36

**Note:**

1. Land pattern complies to IPC-7351.
2. All dimensions in MM.
3. This document (including dimensions, notes & specs) is a recommendation based on typical circuit board manufacturing parameters. Since land pattern design depends on many factors unknown (eg. user's board manufacturing specs), user must determine suitability for use.
