

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

3.3V CMOS Static RAM 1 Meg (128K x 8-Bit) Center Power & Ground Pinout

IDT71V124SA

Features

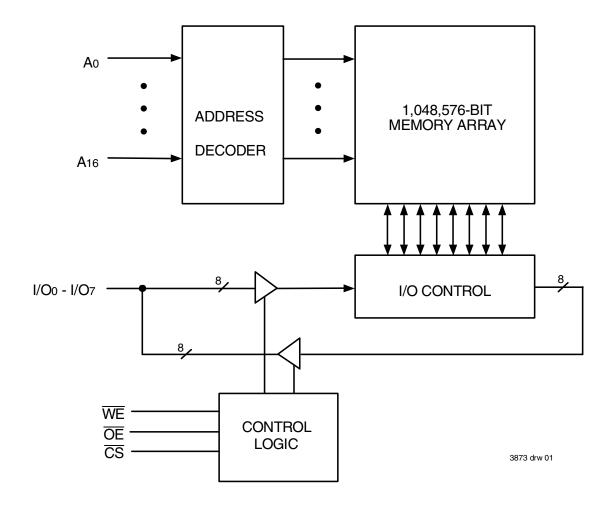

- 128K x 8 advanced high-speed CMOS static RAM
- JEDEC revolutionary pinout (center power/GND) for reduced noise
- Equal access and cycle times
 - Commercial: 10/12/15ns
 - Industrial: 12/15ns
- One Chip Select plus one Output Enable pin
- Inputs and outputs are LVTTL-compatible
- Single 3.3V supply
- Low power consumption via chip deselect
- Available in a 32-pin 300- and 400-mil Plastic SOJ, and 32-pin Type II TSOP packages.

Description

The IDT71V124 is a 1,048,576-bit high-speed static RAM organized as $128K \times 8$. It is fabricated using high-performance, high-reliability CMOS technology. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost-effective solution for high-speed memory needs. The JEDEC center power/GND pinout reduces noise generation and improves system performance.

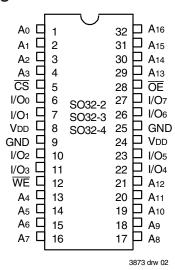

The IDT71V124 has an output enable pin which operates as fast as 5ns, with address access times as fast as 10ns available. All bidirectional inputs and outputs of the IDT71V124 are LVTTL-compatible and operation is from a single 3.3V supply. Fully static asynchronous circuitry is used; no clocks or refreshes are required for operation.

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause
permanent damage to the device. This is a stress rating only and functional operation
of the device at these or any other conditions above those indicated in the operational
sections of this specification is not implied. Exposure to absolute maximum rating
conditions for extended periods may affect reliabilty.

Timing Waveform of Read Cycle No. 1(1)

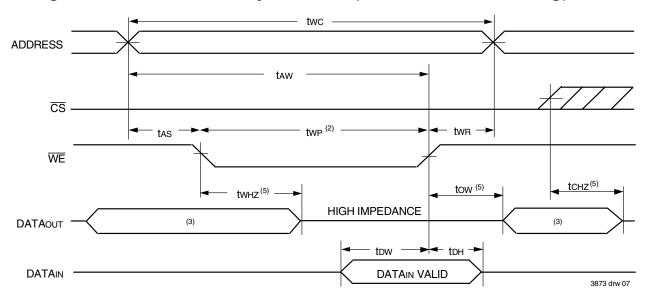

Timing Waveform of Read Cycle No. 2^(1, 2, 4)

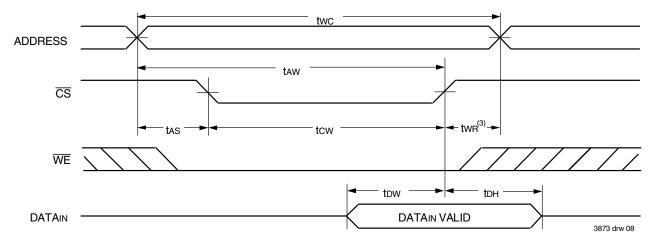

NOTES:

- 1. WE is HIGH for Read Cycle.
- 2. Device is continuously selected, $\overline{\text{CS}}$ is LOW.
- 3. Address must be valid prior to or coincident with the later of $\overline{\text{CS}}$ transition LOW; otherwise tax is the limiting parameter.
- 4. $\overline{\text{OE}}$ is LOW.
- 5. Transition is measured ±200mV from steady state.

Timing Waveform of Write Cycle No. 1 (WE Controlled Timing)(1,2,4)

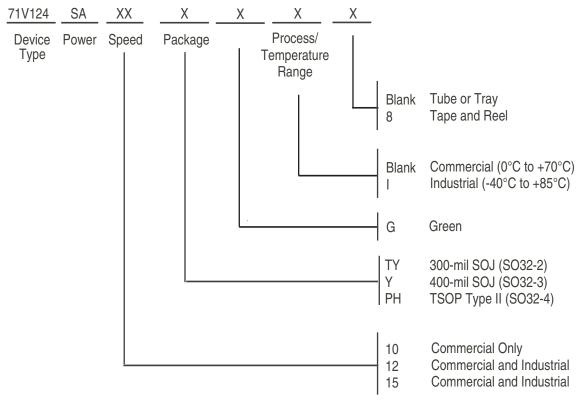

Timing Waveform of Write Cycle No. 2 (CS Controlled Timing)(1, 4)

NOTES:

- 1. A write occurs during the overlap of a LOW \overline{CS} and a LOW \overline{WE} .
- 2. \overline{OE} is continuously HIGH. During a \overline{WE} controlled write cycle with \overline{OE} LOW, twp must be greater than or equal to twhz + tow to allow the I/O drivers to turn off and data to be placed on the bus for the required tow. If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the minimum write pulse is the specified twp.
- 3. During this period, I/O pins are in the output state, and input signals must not be applied.
- 4. If the CSLOW transition occurs simultaneously with or after the WELOW transition, the outputs remain in a high impedance state. CS must be active during the tcw write period.
- 5. Transition is measured ±200mV from steady state.
