### SLG59M1448V Power-Up/Power-Down Sequence Considerations

To ensure glitch-free power-up under all conditions, apply  $V_{DD}$  first, followed by  $V_D$  after  $V_{DD}$  exceeds 1 V. Then allow  $V_D$  to reach 90% of its max value before toggling the ON pin from Low-to-High. Likewise, power-down in reverse order.

If  $V_{DD}$  and  $V_D$  need to be powered up simultaneously, glitching can be minimized by having a suitable load capacitor. A 10  $\mu\text{F}$   $C_{LOAD}$  will prevent glitches for rise times of  $V_{DD}$  and  $V_D$  less than 2 ms.

If the ON pin is toggled HIGH before  $V_{DD}$  and  $V_D$  have reached their steady-state values, the IPS timing parameters may differ from datasheet specifications.

The slew rate of output  $V_S$  follows a linear ramp set by a capacitor connected to the CAP pin. A larger capacitor value at the CAP pin produces a slower ramp, reducing inrush current from capacitive loads.

### SLG59M1448V Current Limiting

The SLG59M1448V has two modes of current limiting, differentiated by the output (Source pin) voltage.

#### 1. Standard Current Limiting Mode (with Thermal Protection)

When  $V(S) > 250$  mV, the output current is initially limited to the Active Current Limit specification given in the Electrical Characteristics table. The current limiting circuit is very fast and responds within a few micro-seconds to sudden loads. When overload is sensed, the current limiting circuit increases the FET resistance to keep the current from exceeding the Active Current Limit.

However, if an overload condition persists, the die temperature rise due to the increased FET resistance while at maximum current can activate Thermal Protection. If the die temperature exceeds the  $THERM_{ON}$  specification, the FET is shut completely OFF, allowing the die to cool. When the die cools to the  $THERM_{OFF}$  temperature, the FET is allowed to turn back on. This process may repeat as long as the overload condition is present.

#### 2. Short Circuit Current Limiting Mode (with Thermal Protection)

When  $V(S) < 250$  mV (which is the case with a hard short, such as a solder bridge on the power rail), the current is limited to approximately 500 mA. Thermal Protection is also present, but since the Short Circuit Current Limit is much lower than Standard Current Limit, activation may only occur at higher ambient temperatures.
